

WEEK 8

To construct a simple LAN and understand the concept and operation of Address Resolution Protocol (ARP).

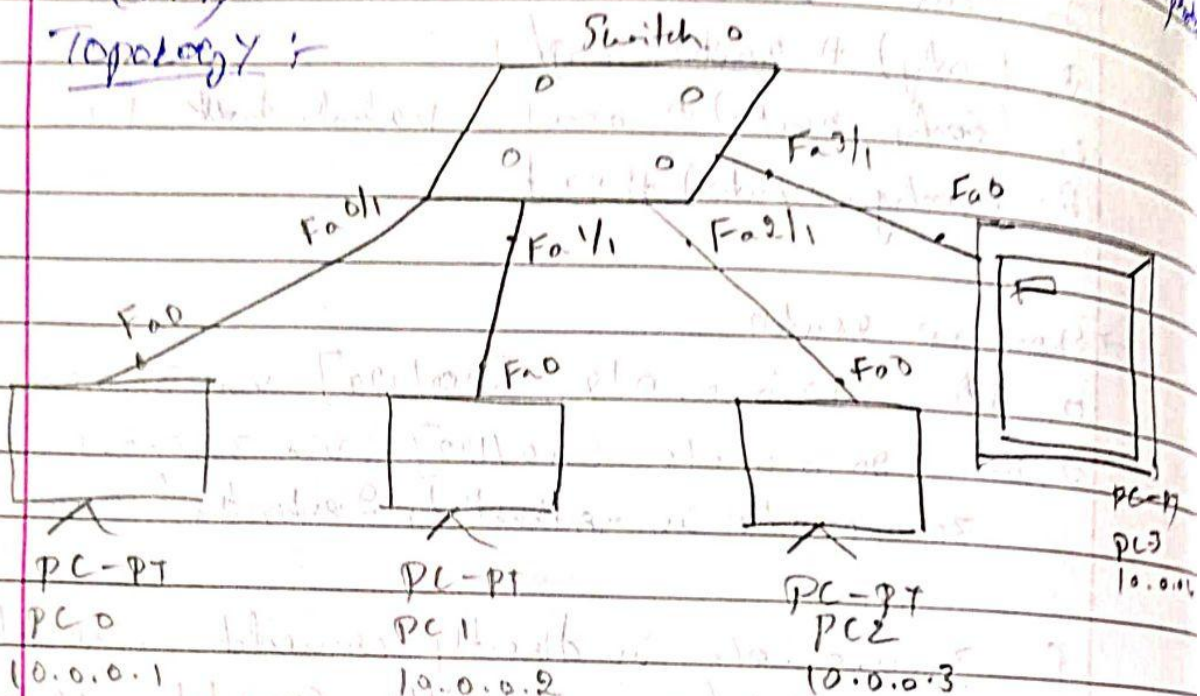

OBSERVATION:

LAB-8

AIM:

To construct single LAN and understand the concept and operation of Address Resolution Protocol (ARP)

Topology:

Procedure:

- Create a topology of PCs and a server.
- Assign a IP address to all PCs and server.
- Connect them through the switch.
- Use the inspect tool to click on a PC to see ARP table.
- Command in cmd for the same is arp -a.
- Initially ARP table is empty.

- Use the capture button in the simulation panel to go step by step so that the changes in ARP can be clearly noted.

PING OUTPUT

PC > ping 10.0.0.4

Pinging 10.0.0.4 with 32 bytes of data:

Reply from 10.0.0.4: bytes=32 time=0ms TTL=128

Reply from 10.0.0.4: bytes=32 time=0ms TTL=128

Reply from 10.0.0.4: bytes=32 time=0ms TTL=128.

Ping statistics for 10.0.0.4:

packets sent=4 Received=4 lost=0 (0% loss)

Approximate round trip times in milliseconds:

Minimum=0 ms ; Maximum=0 ms ; Average=0 ms

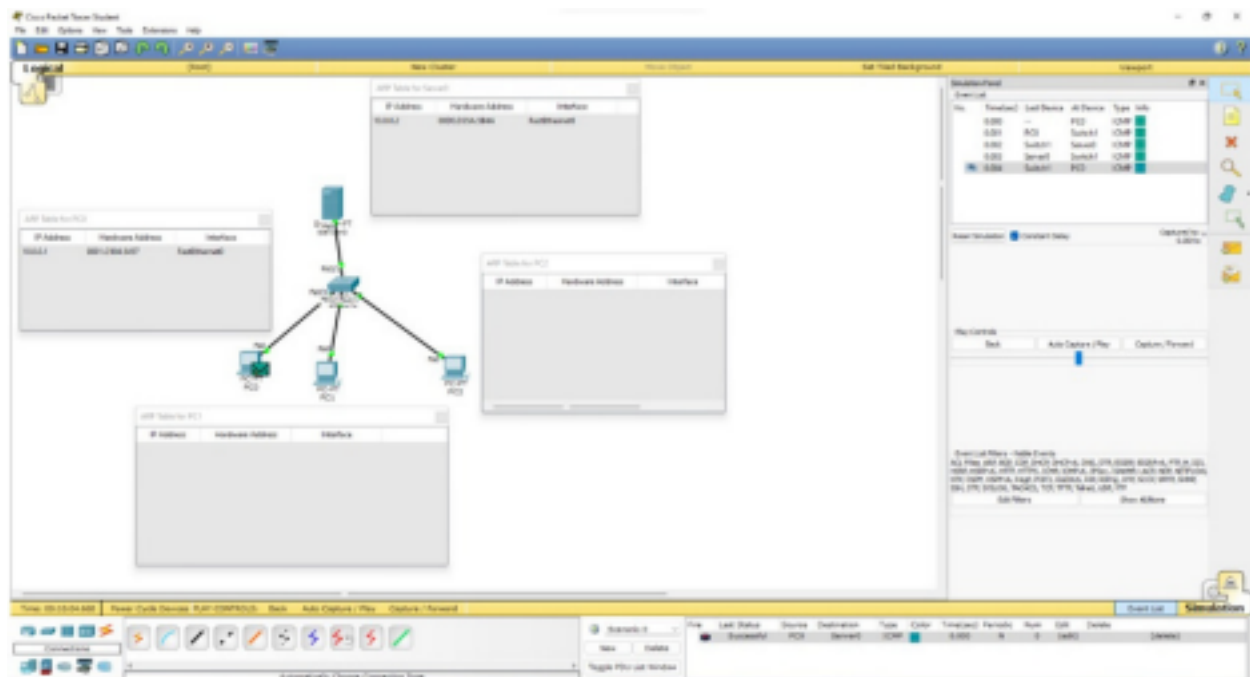

PC > ipconfig

Internet address	Physical Address	Type
10.0.0.4	0060.2fa0.32cd	dynamic

Observation

- When we ping 1 pc and server the address of server is known to pc and vice versa.
- When we ping between other 2 pc's simultaneously the address of each other are known.
- Every time a host request a MAC address in order
